

# AI Enablement Workshop

Juan C Hernandez -Moreno

August 2, 2026 v-12

## A Task-Centered Approach to AI Adoption

### Overview

This workshop was developed in response to a practical question that many organizations are now facing:

**How do we help people adopt AI in ways that improve work, rather than simply introducing another digital tool?**

The workshop is designed for professionals who want practical, responsible ways to integrate AI into their daily work. Instead of focusing on technology demonstrations or prompt libraries, it begins with the work itself. Participants identify meaningful work tasks, evaluate where AI can add value, and build simple, reusable workflows that can be applied immediately in their own roles.

The workshop is delivered through a MoodleCloud learning environment that supports guided activities, reflection, documentation, and reusable learning resources. It has been implemented in private executive coaching engagements and was intentionally designed to support future delivery at team and organizational level.

---

## Why This Workshop Is Different

Many AI workshops follow a familiar sequence:

**Tool → Features → Prompts → Practice**

While this approach helps people become familiar with AI tools, it often leaves participants wondering how to apply what they have learned within their own work.

This workshop follows a different sequence:

**Work Task → Opportunity → AI Tool → Prompt → Evaluation → Workflow → Adoption**

The starting point is not the technology.

The starting point is the participant's work.

This reflects how organizations typically implement new technologies. Business objectives, operational tasks, and measurable outcomes come before tool selection.

---

## Designed Around Real Work

Rather than teaching AI in isolation, the workshop encourages participants to analyze their own responsibilities and identify realistic opportunities for AI support.

Activities focus on questions such as:

- Which tasks consume the most time?
- Which activities are repetitive?
- Where can AI improve quality or consistency?
- Where should human judgement remain central?
- How can AI become part of an existing workflow rather than an additional task?

By the end of the workshop, each participant has developed an AI-assisted workflow connected to a genuine work activity.

---

## Facilitation Approach

The workshop reflects a facilitation-first approach to learning.

Participants learn through guided exploration, discussion, experimentation, and reflection rather than extended presentations.

The role of the facilitator is to:

- guide analysis rather than provide ready-made answers
- encourage critical evaluation of AI outputs
- support discussion around responsible AI use
- help participants build confidence through practice

- adapt activities to participants' professional contexts

The emphasis is on developing independent capability rather than dependence on predefined prompts or fixed procedures.

---

## A Flexible Framework Rather Than a Fixed Programme

Every organization works differently.

For that reason, the workshop has been designed as a flexible framework rather than a one-size-fits-all training package.

Activities, case studies, examples, AI tools, and learning resources can be adapted to different sectors, professional roles, and organizational priorities while maintaining the same structured learning process.

This makes the workshop suitable for bespoke engagements where training is aligned with existing workflows, business objectives, and organizational change initiatives.

## Supporting AI Adoption Through Change Management

Successful AI implementation depends on people as much as technology.

The workshop incorporates principles from the Prosci ADKAR change management model to support sustainable adoption.

Participants are guided through a progression that helps them:

- understand why change is needed
- identify personal and organizational value
- develop practical knowledge
- build confidence through guided practice
- create an action plan that supports continued use after the workshop

The objective is not simply to introduce AI tools, but to encourage practical, responsible, and sustainable adoption.

---

## Digital Learning Environment

The workshop is supported by a MoodleCloud platform developed as part of this project.

The platform includes:

- interactive learning activities
- guided workplace analysis
- reusable templates
- prompt documentation
- workflow planning tools
- reflective activities
- curated learning resources

These materials allow participants to continue learning after the workshop and provide organizations with reusable resources that can support future training.

## O\*NET-Based Task Analysis Framework

One of the distinguishing features of the workshop is an independently developed framework that connects occupational tasks to AI opportunities.

Using occupational data from the O\*NET framework, I designed a Moodle-based resource that supports the analysis of more than 90,000 occupational task identifiers.

The framework helps participants move beyond general discussions about AI by connecting specific work activities with appropriate AI tools, prompt strategies, workflow documentation, and human review points.

Rather than asking, *"What can this AI tool do?"*, participants ask a more useful question:

*"Which of my work tasks could be improved, and what is the most appropriate way to use AI?"*

This task-first perspective keeps AI grounded in practical business needs.

---

## Measuring Meaningful Outcomes

The workshop is designed around authentic workplace outputs rather than knowledge recall.

Participants produce practical artefacts throughout the learning process, including:

- AI opportunity analyses
- prompt iterations
- evaluated AI outputs
- documented workflows
- personal implementation plans

Where appropriate, learning analytics can be incorporated to evaluate engagement, workflow completion, confidence growth, and post-workshop adoption.

## Suitable Applications

The framework is particularly well suited to organizations that want to move beyond introductory AI awareness sessions and begin integrating AI into everyday work.

It is suitable for highly regulated operations including:

- financial services
- insurance
- education
- administrative functions
- organizational support teams

The workshop can be adapted to support both individual coaching and larger organizational learning initiatives.

---

## Current Stage of Development

The workshop has been developed as an independent AI enablement initiative and has been applied in private executive coaching contexts to refine activities, learning materials, and facilitation methods.

Although it has not yet been deployed as a large-scale corporate program, the framework, Moodle learning environment, documentation, and workflow resources were designed from the outset with scalability in mind, making it suitable for future organizational implementation.

---

## Guiding Principle

Technology adoption is most effective when learning begins with work rather than software.

This workshop reflects that principle by helping participants identify meaningful opportunities for AI, evaluate them critically, and develop practical workflows that support responsible, sustainable improvements in the way they work.
